

AI CONTROL LAYER · HACKYEAH 2026

LLMinator

The security gateway between your AI agents and everything they could break.

Live now, on a Raspberry Pi → **llminator.fmroz.me** `admin / admin` `chat1 / chat1`

TEAM CORSBUSTERS Anna Franczyk · Filip Mroz · Marcin Witek · Dawid Pater · Jakub Kozik · Marcin Kalas

THE PROBLEM

AI reads language as **code**.

Classic security tools were never built for that.

**Prompt
injection**

Data leakage

Runaway spend

Known exploits

16

published CVEs in Ollama alone

the model server we protect · source: OSV.dev

One gateway. Every request. Every response.

Rules in microseconds. **AI** where meaning counts.

0.03_{ms}

to scan a prompt for secrets, with **222** rules

95%

of explicit injection attempts caught on the public deepset test, with **0%** false alarms on its benign prompts

13x faster

repeat verdicts: 546 ms → 41 ms, from the guard cache

DETERMINISTIC · JAVA

Secrets · PII · attack signatures · budgets

SEMANTIC · SWAPPABLE PROVIDER

Injection classifier · fail-closed

Simsonsun 83% caught · NotInject 2.7% and OR-Bench 0.0% false alarms

HONEST LIMITS OF THE AI LAYER

Role-play jailbreaks

only partly caught

Instructions hidden in long documents

weaker, more false alarms

English only

AI checks on tool calls and answers: next

AI is one signal, never the only gate: rules and policy decide independently.

Test-grade models today. A stronger one drops in with a config change.

Every decision comes with its receipts.

Explainable Verdict

BLOCK

by PII-RECOGNIZERS

request b1040e9e-3d6b-4ae5-99d0-438b8648fda2

policy v4 · 7f147821

TIMING

20 ms total · checks 16 ms (79%)

deterministic checks 16 ms

model + network 4.3 ms

rate.requests

gate

15 ms

budget.daily_cap

gate

454 μs

PII-RECOGNIZERS

input

384 μs

SEC-GITLEAKS

input

35 μs

model.allowlist

gate

16 μs

Slowest check: rate.requests — 15 ms.

CONTROL PATH

1 hit in 5 checks

PII-RECOGNIZERS block at input · msg 1 — PII-001/PL_PESSEL×1 [pattern PESSEL 0.40 → pesel:valid 1.00 → context 'pesel' 1.00]

My PESEL number is 44051401359, can you check if it is valid?

BLOCK

PII-RECOGNIZERS

PII-001 / PL_PESSEL

pattern 0.40 → checksum valid 1.00 → context “pesel” 1.00

20ms

whole request

0

tokens reached the model

Every check with its own time · score vs. threshold as numbers · no raw PII in trace or audit

Policy is **data**. Change it live.

Guards

Controls run in order (lower first) on every request. A disabled guard does not run at all.

PII-RECOGNIZERS

deterministic · input, output, tool_call

order100

Detection threshold

0.5

Minimum confidence for a PII finding. Lower catches more, with more false positives.

RECOGNIZER	ENTITY	ACTION
PII-001 Polish PESEL	PL_PESSEL	block
PII-002 Polish NIP	PL_NIP	default (redact)
PII-003 Polish REGON	PL_REGON	default (redact)
PII-004 Polish identity card	PL_ID_CARD	default (redact)
PII-005 E-mail address	EMAIL_ADDRESS	monitor only
PII-006 Polish phone number	PHONE_NUMBER	default (redact)
PII-007 Payment card number	CREDIT_CARD	default (redact)
PII-008 IBAN / Polish NRB	IBAN_CODE	default (redact)

NO RESTART

Live from the next request

VERSIONED

Author, hash, instant restore

PER-CONTROL MODE

offmonitorredactblock

Spend is capped. Evidence is **tamper-evident.**

429

daily token budget gone: stopped before the model

HMAC

chained audit of every request, allow *and* deny

p95

latency, blocks, budgets in the dashboard

Known exploits die at the **door**. So do leaks.

WHY LLMINATOR

Secure AI without **slowing** **developers.**

✓	Robustness	Rules + calibrated AI, fail-closed
✓	Performance	Microsecond rules, cached verdicts
✓	Reporting	X-ray, tamper-evident audit, dashboard
✓	Testing	348 tests, positive and negative, CI
✓	Practicality	Drop-in gateway, swappable AI provider, runs on a Pi

NEXT Red Team Arena · MCP tool-call controls · policy simulation on recorded traffic

Don't take our word for it.
Try to break it.
